

CLAIMS

1. (Currently Amended) A semiconductor device, comprising:
 - a substrate having circuitry formed therein;
 - a passivation layer formed overlying at least a portion of the substrate;
 - a fuse, which may be selectively open-circuited, formed overlying the passivation layer; and
 - a packaging material formed over in contact with the fuse, wherein the packaging material is selected from the group consisting of a mold compound and an underfill.
2. (Original) A semiconductor device as in claim 1, wherein a recessed area is formed in the passivation layer and wherein at least a portion of the fuse is formed in the recessed area.
3. (Original) A semiconductor device as in claim 1, wherein the fuse comprises a metal.
4. (Original) A semiconductor device as in claim 3, wherein the fuse comprises aluminum.
5. (Original) A semiconductor device as in claim 1, wherein the fuse comprises a metal nitride.
6. (Original) A semiconductor device as in claim 1, wherein the fuse comprises a metal and a metal nitride.
7. (Original) A semiconductor device as in claim 1, wherein the fuse comprises a metal having a thickness less than approximately 1 micron.

8. (Original) A semiconductor device as in claim 1, wherein the circuitry comprises a first circuit and a second circuit, the semiconductor device further comprising:
 a first interconnect for electrically connecting the first circuit to a first portion of the fuse; and
 a second interconnect for electrically connecting a second circuit to a second portion of the fuse,
 wherein the first circuit and the second circuit are no longer electrically connected if the fuse is open-circuited.
9. (Original) A semiconductor device as in claim 1, wherein the fuse is electrically connected to only the circuitry, and is not electrically connected to anything external to the circuitry.
10. (Previously Canceled)
11. (Currently Amended) A semiconductor device, comprising:
 a substrate having a first circuit formed therein, ~~and~~ a second circuit formed therein, and a fuse, wherein:
 the first circuit has a first contact area, ~~and~~
 the second circuit has a second contact area; and
the fuse, which may be selectively open-circuited, is formed overlying the passivation layer, the fuse having a third contact area which is electrically coupled to the first contact area of the first circuit, and the fuse having a fourth contact area which is electrically coupled to the second contact area of the second circuit, wherein the first contact area of the first circuit and the second contact area of the second circuit are no longer electrically connected if the fuse is open-circuited;
 a passivation layer formed overlying at least a portion of the substrate, wherein the fuse is ;

a fuse, which may be selectively open-circuited, formed overlying the passivation layer, the fuse having a third contact area which is electrically coupled to the first contact area of the first circuit, and the fuse having a fourth contact area which is electrically coupled to the second contact area of the second circuit, wherein the first contact area of the first circuit and the second contact area of the second circuit are no longer electrically connected if the fuse is open-circuited; and

a packaging material formed over the fuse, wherein the packaging material is selected from the group consisting of a mold compound and an underfill.

12. (Original) A semiconductor device as in claim 11, wherein a recessed area is formed in the passivation layer and wherein at least a portion of the fuse is formed in the recessed area.
13. (Original) A semiconductor device as in claim 11, wherein the fuse comprises a metal.
14. (Original) A semiconductor device as in claim 13, wherein the fuse comprises aluminum.
15. (Original) A semiconductor device as in claim 11, wherein the fuse comprises a metal nitride.
16. (Original) A semiconductor device as in claim 11, wherein the fuse comprises a metal and a metal nitride.
17. (Original) A semiconductor device as in claim 11, wherein the first contact area of the first circuit and the second contact area of the second circuit are electrically connected only by way of the fuse.

18. (Currently Amended) A method for forming a semiconductor device having a fuse, comprising:
- providing a substrate;
 - forming a passivation layer overlying at least a portion of the substrate;
 - forming the fuse overlying the passivation layer; and
 - forming a packaging material ~~over~~ in contact with the fuse, wherein the packaging material is selected from the group consisting of a mold compound and an underfill.
19. (Previously Canceled)
20. (Currently Amended) A method of claim 18, further comprising:
- blowing the fuse before forming a packaging material ~~on the fuse~~.
21. (Currently Amended) A semiconductor device as in claim ~~[[1]]~~ 11, wherein the packaging material is formed on the fuse.
22. (Canceled)
